Trigger Yield Optimization Notes linked to Hartford Financial Services Group, Inc.

Description

Deutsche Bank issued \$20.49 million of Trigger Yield Optimization Notes linked to Hartford Financial Services Group, Inc. on June 22, 2011 at \$24.44 per note.

These notes are Deutsche Bank-branded single observation reverse convertibles. Single observation reverse convertibles pay periodic interest coupons and at maturity convert into shares of the reference security if the price of the reference security at the notes' maturity is below the trigger price determined when the notes were issued.

These 12-month notes pay monthly coupons at an annualized rate of 10.00%. In addition to the monthly coupons, on June 22, 2012 investors will receive the market value of one share of Hartford Financial Services Group, Inc.'s stock if on June 18, 2012 Hartford Financial Services Group, Inc.'s stock closes below \$19.55 (80% of Hartford Financial Services Group, Inc.'s stock price on June 17, 2011). Otherwise, investors will receive the \$24.44 face value per note.

Valuation

This Deutsche Bank single observation reverse convertible linked to Hartford Financial Services Group, Inc.'s stock can be valued as a combination of a note from Deutsche Bank and a short European out-of-the-money cash-or-nothing binary put option, and a short European out-of-the-money put option on Hartford Financial Services Group, Inc.'s stock. For reasonable valuation inputs this note was worth \$23.64 per \$24.44 when it was issued on June 22, 2011 because investors were effectively being paid only \$2.18 for giving Deutsche Bank options which were worth \$2.99.

There is no active secondary market for most structured products. Structured products, including this note, therefore are much less liquid than simple stocks, bonds, notes and mutual funds. Investors are likely to receive less than the structured product's estimated market value if they try to sell the structured product prior to maturity. Our valuations do not incorporate this relative lack of liquidity and therefore should be considered an upper bound on the value of the structured product.

Payoff Curve at Maturity

The payoff diagram shows the final payoff of this note given Hartford Financial Services Group, Inc.'s stock price (horizontal axis). For comparison, the dashed line shows the payoff if you invested in Hartford Financial Services Group, Inc.'s stock directly.

Analysis

This single observation reverse convertible's 10.00% coupon rate is higher than the yield Deutsche Bank paid on its straight debt but, in addition to Deutsche Bank's credit risk, investors bear the risk that they will receive shares of Hartford Financial Services Group, Inc.'s stock when those shares are worth substantially less than the face value of the note at maturity.

Investors purchasing these reverse convertibles effectively sell put options to Deutsche Bank and post the note's issue price as collateral to secure satisfaction of the investors' obligations under the option contracts. Deutsche Bank pays investors a "coupon" that is part payment for the put options and part interest on the investors' posted collateral. This reverse convertible is fairly priced if and only if the difference between the reverse convertible's "coupon rate" and interest paid on Deutsche Bank's straight debt equals the value of the put option investors are giving to Deutsche Bank. Whether this reverse convertible is suitable or not is identically equivalent to whether selling put options on the reference stock at the option premium being paid by Deutsche Bank was suitable for the investor.

Deutsche Bank's Stock Price

The graph above shows the adjusted closing price of the issuer Deutsche Bank for the past several years. The stock price of the issuer is an indication of the financial strength of Deutsche Bank. The adjusted price shown above incorporates any stock split, reverse stock split, etc.

Deutsche Bank's CDS Rate

Credit default swap (CDS) rates are the market price that investors require to bear credit risk of an issuer such as Deutsche Bank. CDS rates are usually given in basis points (bps). One basis point equals 0.01%. Higher CDS rates reflect higher perceived credit risk, higher required yields, and therefore lower market value of Deutsche Bank's debt, including outstanding Trigger Yield Optimization Note. Fluctuations in Deutsche Bank's CDS rate impact the market value of the notes in the secondary market.

Hartford Financial Services Group, Inc.'s Stock Price

The graph above shows the historical levels of Hartford Financial Services Group, Inc.'s stock for the past several years. The final payoff of this note is determined by Hartford Financial Services Group, Inc.'s stock price at maturity. Higher fluctuations in Hartford Financial Services Group, Inc.'s stock price correspond to a greater uncertainty in the final payout of this Trigger Yield Optimization Note.

Realized Payoff

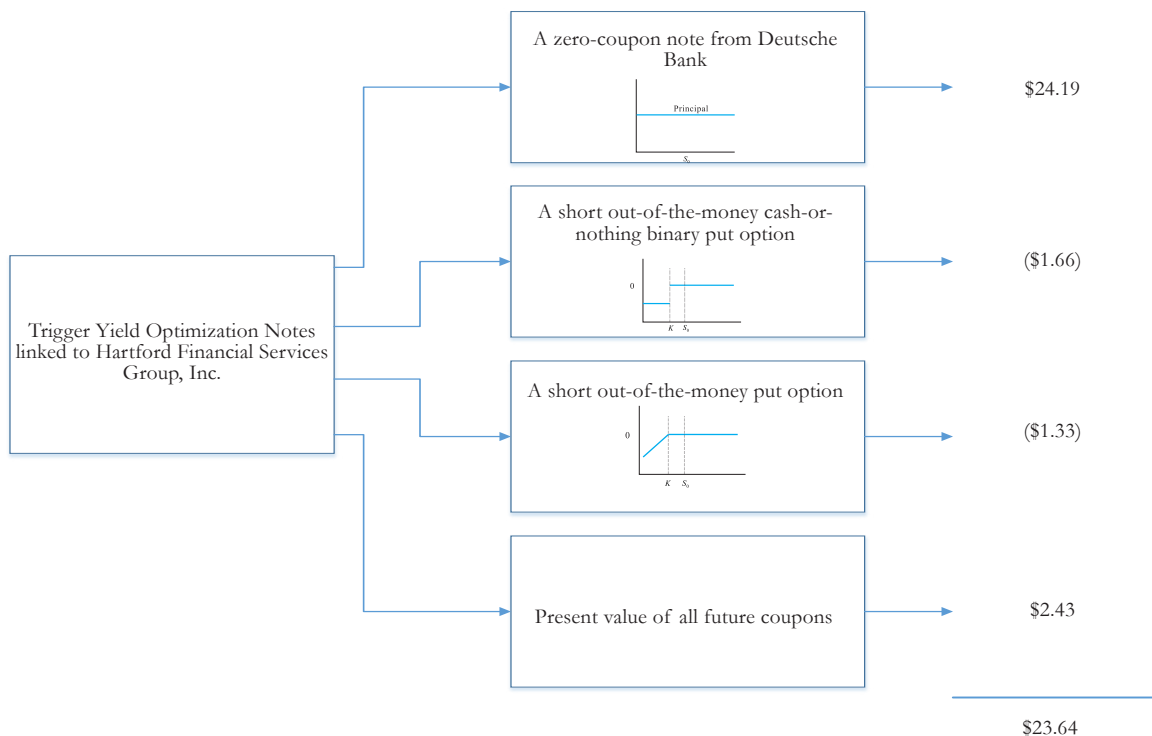

This note matured on June 22, 2012 and investors received \$16.68 per note (or equal to the value of one share of Hartford Financial Services Group, Inc. stock's closing price on June 18, 2012).

Reference Asset Hartford Financial Services Group, Inc.'s Stock's Implied Volatility

The annualized implied volatility of Hartford Financial Services Group, Inc.'s stock on June 17, 2011 was 36.19%, meaning that options contracts on Hartford Financial Services Group, Inc.'s stock were trading at prices that reflect an expected annual volatility of 36.19%. The higher the implied volatility, the larger the expected fluctuations of Hartford Financial Services Group, Inc.'s stock price and of the Note's market value during the life of the Notes.

Decomposition of this Trigger Yield Optimization Note

This note can be decomposed into different components, and each component can be valued separately. The chart above shows the value of each component of this Trigger Yield Optimization Note.

1. Delta measures the sensitivity of the price of the note to the Hartford Financial Services Group, Inc.'s stock price on June 17, 2011.
2. CDS rates can be considered a measure of the probability that an issuer will default over a certain period of time and the likely loss given a default. The lower the CDS rate, the lower the default probability. CDS rate is given in basis points (1 basis point equals 0.01%), and is considered as a market premium, on top of the risk-free rate, that investors require to insure against a potential default.
3. Fair price evaluation is based on the Black-Scholes model of the Hartford Financial Services Group, Inc.'s stock on June 17, 2011.
4. Calculated payout at maturity is only an approximation, and may differ from actual payouts at maturity.
5. Our evaluation does not include any transaction fees, broker commissions, or liquidity discounts on the notes.
