**Trigger Phoenix Autocallable Optimization Securities linked to Intel Corp.**

**Description**

Deutsche Bank issued \$3.82 million of Trigger Phoenix Autocallable Optimization Securities linked to Intel Corp. on September 13, 2012 at \$10 per note.

These 60-month notes are UBS-branded reverse convertible notes. On the monthly coupon observation date, if the notes are not called back, they pay either monthly coupon at an annualized rate of 9.80% if Intel Corp.'s stock price closes above the coupon barrier \$16.93, or no coupon if the stock price closes below the barrier. The first coupon observation date is October 9, 2012. This autocallable notes will be called back if the reference stock price on any monthly call observation date after September 9, 2013 exceeds the initial stock price \$24.19. In this case, investors receive the principal plus any unpaid coupons. At maturity, the notes convert into shares of the reference security—0.41 share of Intel Corp.'s stock in this case—if the market value of the reference stock at the note's maturity is below the trigger price \$16.93 (70% of the reference asset on September 7, 2012). Otherwise, investors will receive the \$10 face value.

**Valuation**

This note can be viewed as a combination of a zero-coupon note from Deutsche Bank, a series of contingent coupon payments, and a short put option on the reference asset. For reasonable valuation inputs this note was worth \$9.46 per \$10 face value when it was issued on September 13, 2012, including \$9.44 for the present value of the zero-coupon note, (\$1.36) for the short put options, and \$1.38 for the present value of all future contingent coupon payments.

There is no active secondary market for most structured products. Structured products, including this note, therefore are much less liquid than simple stocks, bonds, notes and mutual funds. Investors are likely to receive less than the structured product's estimated market value if they try to sell the structured product prior to maturity. Our valuations do not incorporate this relative lack of liquidity and therefore should be considered an upper bound on the value of the structured product.

**Payoff Curve at Maturity**

The payoff diagram shows the final payoff of this note given Intel Corp.'s stock price (horizontal axis). For comparison, the dashed line shows the payoff if you invested in Intel Corp.'s stock directly.

**Analysis**

The 9.80% coupon rate on this Trigger Phoenix Autocallable Optimization Security is higher than those paid by Deutsche Bank on its straight debts but, in addition to Deutsche Bank's credit risk, investors bear the risk that, 1) the note may be called; 2) the note may pay zero coupon because of the coupon contingency; 3) and the note will be converted into shares of Intel Corp.'s stock when Intel Corp.'s stock is worth substantially less than the face value of the note.

Investors purchasing these autocallable phoenix notes effectively sell contingent put options to Deutsche Bank and post the note's issue price as collateral to secure satisfaction of the investors' obligations under the option contracts. Deutsche Bank pays investors a contingent coupon that is part payment for the put options and part interest on the investors' posted collateral. This Trigger Phoenix Autocallable Optimization Security is fairly priced if and only if the difference between the contingent coupon and interest paid on Deutsche Bank's straight debt equals the value of the contingent put options investors are giving to Deutsche Bank. Whether this Trigger Phoenix Autocallable Optimization Security is suitable or not is identically equivalent to whether selling put options on the reference stock at the option premium being paid by Deutsche Bank was suitable for the investor.

**Deutsche Bank's Stock Price**

*The graph above shows the adjusted closing price of the issuer Deutsche Bank for the past several years. The stock price of the issuer is an indication of the financial strength of Deutsche Bank. The adjusted price shown above incorporates any stock split, reverse stock split, etc.*

### Deutsche Bank's CDS Rate

Credit default swap (CDS) rates are the market price that investors require to bear credit risk of an issuer such as Deutsche Bank. CDS rates are usually given in basis points (bps). One basis point equals 0.01%. Higher CDS rates reflect higher perceived credit risk, higher required yields, and therefore lower market value of Deutsche Bank's debt, including outstanding Trigger Phoenix Autocallable Optimization Security. Fluctuations in Deutsche Bank's CDS rate impact the market value of the notes in the secondary market.

### Intel Corp.'s Stock Price

The graph above shows the historical levels of Intel Corp.'s stock for the past several years. The final payoff of this note is determined by Intel Corp.'s stock price at maturity. Higher fluctuations in Intel Corp.'s stock price correspond to a greater uncertainty in the final payout of this Trigger Phoenix Autocallable Optimization Security.

### Realized Payoff

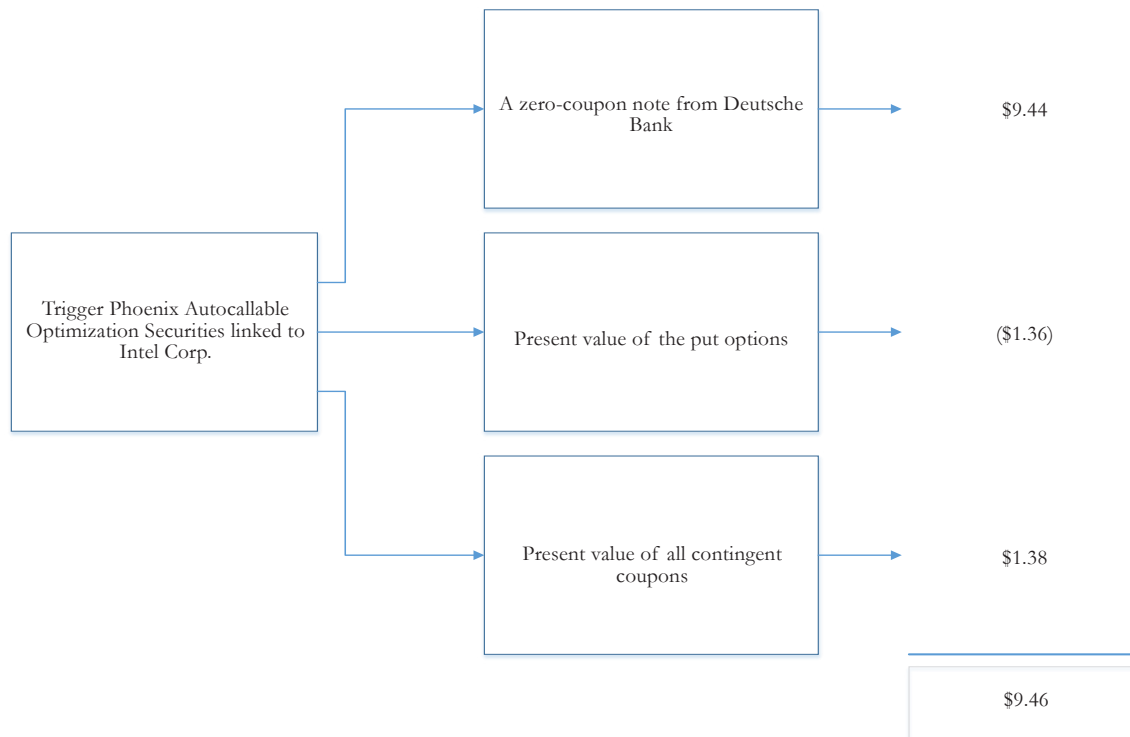

This product will mature on September 13, 2017.

## Reference Asset Intel Corp.'s Stock's Implied Volatility

The annualized implied volatility of Intel Corp.'s stock on September 7, 2012 was 27.38%, meaning that options contracts on Intel Corp.'s stock were trading at prices that reflect an expected annual volatility of 27.38%. The higher the implied volatility, the larger the expected fluctuations of Intel Corp.'s stock price and of the Note's market value during the life of the Notes.

## Decomposition of this Trigger Phoenix Autocallable Optimization Security

This note can be decomposed into different components, and each component can be valued separately. The chart above shows the value of each component of this Trigger Phoenix Autocallable Optimization Security.

1. Delta measures the sensitivity of the price of the note to the Intel Corp.'s stock price on September 7, 2012.
2. CDS rates can be considered a measure of the probability that an issuer will default over a certain period of time and the likely loss given a default. The lower the CDS rate, the lower the default probability. CDS rate is given in basis points (1 basis point equals 0.01%), and is considered as a market premium, on top of the risk-free rate, that investors require to insure against a potential default.
3. Fair price evaluation is based on the Black-Scholes model of the Intel Corp.'s stock on September 7, 2012.
4. Calculated payout at maturity is only an approximation, and may differ from actual payouts at maturity.
5. Our evaluation does not include any transaction fees, broker commissions, or liquidity discounts on the notes.
