**Buffered Accelerated Market Participation Securities linked to Russell 2000 Index**

**Description**

HSBC issued \$3.03 million of Buffered Accelerated Market Participation Securities linked to Russell 2000 Index on April 25, 2012 at \$1,000 per note.

These notes are HSBC-branded Buffered PLUS securities that do not pay periodic coupons, but instead pay a single amount at maturity depending on the final level of the Russell 2000 Index.

If on October 21, 2013 the Russell 2000 Index level is higher than 804.05, but lower than 892.5, the notes pay a return equal to the percentage increase in the Russell 2000 Index multiplied by 2.0, up to a cap of 22.00%. If on October 21, 2013 the refe is below 804.05 but not below 723.65, investors receive \$1,000 face value per note. If the Russell 2000 Index level on October 21, 2013 is lower than 723.65, investors receive face value per note reduced by the amount the reference asset is below 723.65 as a percent of the initial level, 804.05.

**Valuation**

This product can be valued as a combination of a note from HSBC, one short out-of-the-money put option, two long at-the-money call options, and two short out-of-the-money call options. For reasonable valuation inputs this note was worth \$957.33 when it was issued on April 25, 2012 because the value of the options investors gave HSBC plus the interest investors would have received on HSBC's straight debt was worth \$42.67 more than the options investors received from HSBC.

There is no active secondary market for most structured products. Structured products, including this note, therefore are much less liquid than simple stocks, bonds, notes and mutual funds. Investors are likely to receive less than the structured product's estimated market value if they try to sell the structured product prior to maturity. Our valuations do not incorporate this relative lack of liquidity and therefore should be considered an upper bound on the value of the structured product.

**Payoff Curve at Maturity**

The payoff diagram shows the final payoff of this note given the Russell 2000 Index level (horizontal axis). For comparison, the dashed line shows the payoff if you invested in the Russell 2000 Index directly.

1,125.67	\$1,220.00
1,206.08	\$1,220.00

### Maturity Payoff Diagram

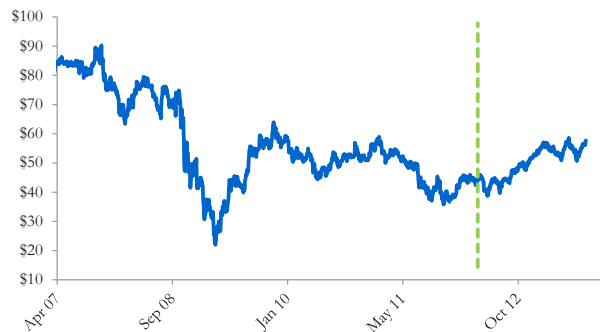

The contingent payoffs of this Buffered Accelerated Market Participation Security.

### Analysis

This Buffered Accelerated Market Participation Security pays investors the increase in the Russell 2000 Index multiplied by 2.0 capped at 22.00%, but if the Russell 2000 Index declines over the term of the note, investors will suffer losses equal to the percentage decline in the Russell 2000 Index. In addition, investors bear the credit risk of HSBC. Investors purchasing this Buffered Accelerated Market Participation Security effectively sell at-the-money put and out-of-the-money call options to HSBC, buy at-the-money call options, and a zero-coupon note from HSBC. This Buffered Accelerated Market Participation Security is fairly priced if and only if the market value of the options investors received from HSBC equals the market value of the options investors gave HSBC plus the interest investors would have received on HSBC's straight debt.

### HSBC's Stock Price

The graph above shows the adjusted closing price of the issuer HSBC for the past several years. The stock price of the issuer is an indication of the financial strength of HSBC. The adjusted price shown above incorporates any stock split, reverse stock split, etc.

### HSBC's CDS Rate

Credit default swap (CDS) rates are the market price that investors require to bear credit risk of an issuer such as HSBC. CDS rates are usually given in basis points (bps). One basis point equals 0.01%. Higher CDS rates reflect higher perceived credit risk, higher required yields, and therefore lower market value of HSBC's debt, including outstanding Buffered Accelerated Market Participation Security. Fluctuations in HSBC's CDS rate impact the market value of the notes in the secondary market.

### The Russell 2000 Index Level

The graph above shows the historical levels of the Russell 2000 Index for the past several years. The final payoff of this note is determined by the Russell 2000 Index level at maturity. Higher fluctuations in the Russell 2000 Index level correspond to a greater uncertainty in the final payout of this Buffered Accelerated Market Participation Security.

### Realized Payoff

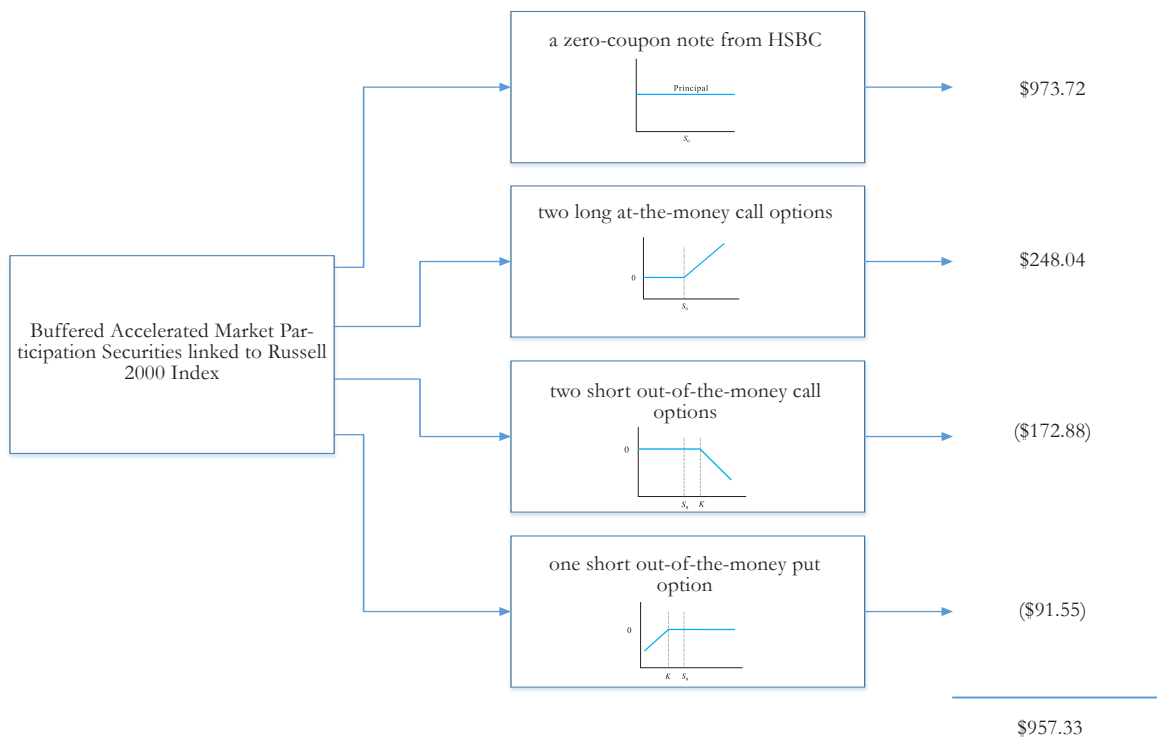

This product will mature on October 24, 2013.

## Reference Asset The Russell 2000 Index's Implied Volatility

The annualized implied volatility of the Russell 2000 Index on April 20, 2012 was 28.47%, meaning that options contracts on the Russell 2000 Index were trading at prices that reflect an expected annual volatility of 28.47%. The higher the implied volatility, the larger the expected fluctuations of the Russell 2000 Index level and of the Note's market value during the life of the Notes.

## Decomposition of this Buffered Accelerated Market Participation Security

This note can be decomposed into different components, and each component can be valued separately. The chart above shows the value of each component of this Buffered Accelerated Market Participation Security.

1. Delta measures the sensitivity of the price of the note to the the Russell 2000 Index level on April 20, 2012.
2. CDS rates can be considered a measure of the probability that an issuer will default over a certain period of time and the likely loss given a default. The lower the CDS rate, the lower the default probability. CDS rate is given in basis points (1 basis point equals 0.01%), and is considered as a market premium, on top of the risk-free rate, that investors require to insure against a potential default.
3. Fair price evaluation is based on the Black-Scholes model of the the Russell 2000 Index on April 20, 2012.
4. Calculated payout at maturity is only an approximation, and may differ from actual payouts at maturity.
5. Our evaluation does not include any transaction fees, broker commissions, or liquidity discounts on the notes.
