Yield Optimization Notes linked to General Electric Company

Description

JPMorgan issued \$3.00 million of Yield Optimization Notes linked to General Electric Company on April 8, 2009 at \$10.94 per note.

These notes are JPMorgan-branded single observation reverse convertibles. Single observation reverse convertibles pay periodic interest coupons and at maturity convert into shares of the reference security if the price of the reference security at the notes' maturity is below the trigger price determined when the notes were issued.

These 24-month notes pay monthly coupons at an annualized rate of 12.30%. In addition to the monthly coupons, on April 8, 2011 investors will receive the market value of one share of General Electric Company's stock if on April 4, 2011 General Electric Company's stock closes below \$6.56 (60% of General Electric Company's stock price on April 3, 2009). Otherwise, investors will receive the \$10.94 face value per note.

Valuation

This JPMorgan single observation reverse convertible linked to General Electric Company's stock can be valued as a combination of a note from JPMorgan and a short European out-of-the-money cash-or-nothing put option, and a short European out-of-the-money put option on General Electric Company's stock. For reasonable valuation inputs this note was worth \$8.98 per \$10.94 when it was issued on April 8, 2009 because investors were effectively being paid only \$1.81 for giving JPMorgan options which were worth \$3.77.

There is no active secondary market for most structured products. Structured products, including this note, therefore are much less liquid than simple stocks, bonds, notes and mutual funds. Investors are likely to receive less than the structured product's estimated market value if they try to sell the structured product prior to maturity. Our valuations do not incorporate this relative lack of liquidity and therefore should be considered an upper bound on the value of the structured product.

Payoff Curve at Maturity

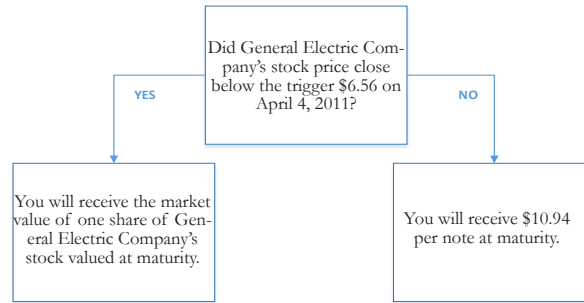

The payoff diagram shows the final payoff of this note given General Electric Company's stock price (horizontal axis). For comparison, the dashed line shows the payoff if you invested in General Electric Company's stock directly.

Principal Payback Table

General Electric Company's Stock	Note Payoff
\$0.00	\$0.00
\$1.09	\$1.09
\$2.19	\$2.19
\$3.28	\$3.28
\$4.38	\$4.38
\$5.47	\$5.47
\$6.56	\$6.56
\$7.66	\$10.94
\$8.75	\$10.94
\$9.85	\$10.94
\$10.94	\$10.94
\$12.03	\$10.94
\$13.13	\$10.94
\$14.22	\$10.94
\$15.32	\$10.94
\$16.41	\$10.94

Analysis

This single observation reverse convertible's 12.30% coupon rate is higher than the yield JPMorgan paid on its straight debt but, in addition to JPMorgan's credit risk, investors bear the risk that they will receive shares of General Electric Company's stock when those shares are worth substantially less than the face value of the note at maturity.

Investors purchasing these reverse convertibles effectively sell put options to JPMorgan and post the note's issue price as collateral to secure satisfaction of the investors' obligations under the option contracts. JPMorgan pays investors a "coupon" that is part payment for the put options and part interest on the investors' posted collateral. This reverse convertible is fairly priced if and only if the difference between the reverse convertible's "coupon rate" and interest paid on JPMorgan's straight debt equals the value of the put option investors are giving to JPMorgan. Whether this reverse convertible is suitable or not is identically equivalent to whether selling put options on the reference stock at the option premium being paid by JPMorgan was suitable for the investor.

JPMorgan's Stock Price

The graph above shows the adjusted closing price of the issuer JPMorgan for the past several years. The stock price of the issuer is an indication of the financial strength of JPMorgan. The adjusted price shown above incorporates any stock split, reverse stock split, etc.

JPMorgan's CDS Rate

Credit default swap (CDS) rates are the market price that investors require to bear credit risk of an issuer such as JPMorgan. CDS rates are usually given in basis points (bps). One basis point equals 0.01%. Higher CDS rates reflect higher perceived credit risk, higher required yields, and therefore lower market value of JPMorgan's debt, including outstanding Yield Optimization Note. Fluctuations in JPMorgan's CDS rate impact the market value of the notes in the secondary market.

General Electric Company's Stock Price

The graph above shows the historical levels of General Electric Company's stock for the past several years. The final payoff of this note is determined by General Electric Company's stock price at maturity. Higher fluctuations in General Electric Company's stock price correspond to a greater uncertainty in the final payout of this Yield Optimization Note.

Realized Payoff

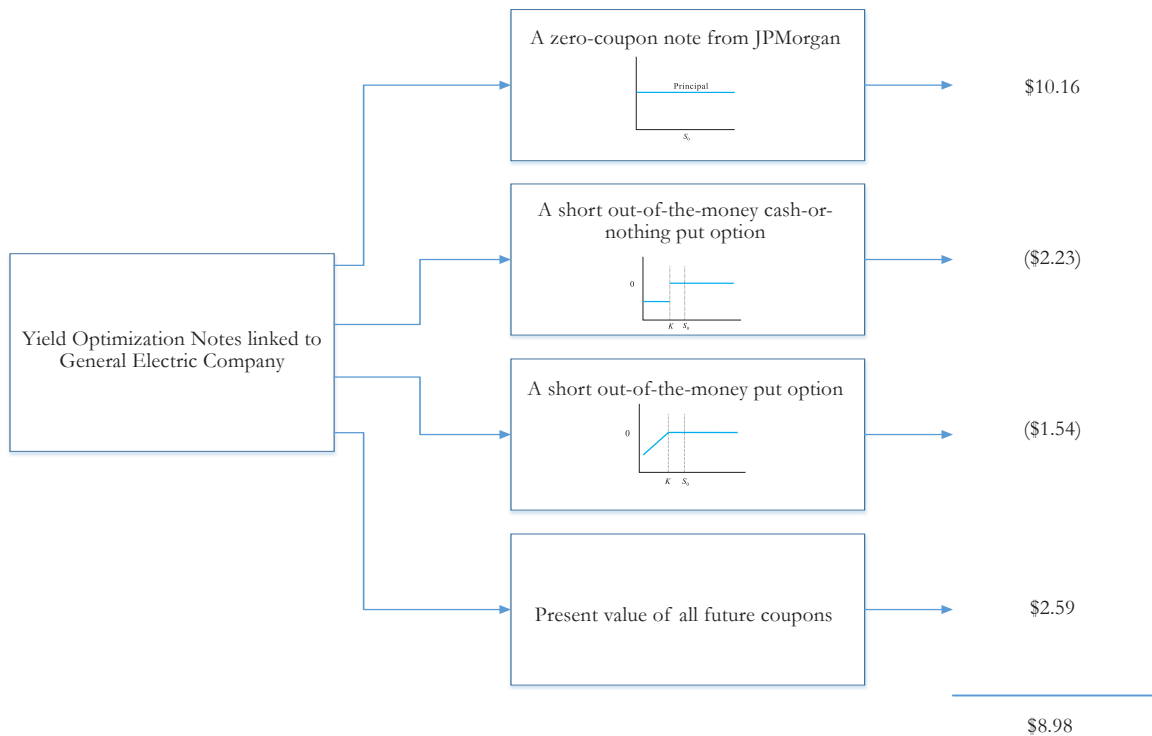

This note matured on April 8, 2011 and investors received \$10.94 per note.

Reference Asset General Electric Company's Stock's Implied Volatility

The annualized implied volatility of General Electric Company's stock on April 3, 2009 was 62.94%, meaning that options contracts on General Electric Company's stock were trading at prices that reflect an expected annual volatility of 62.94%. The higher the implied volatility, the larger the expected fluctuations of General Electric Company's stock price and of the Note's market value during the life of the Notes.

Decomposition of this Yield Optimization Note

This note can be decomposed into different components, and each component can be valued separately. The chart above shows the value of each component of this Yield Optimization Note.

1. Delta measures the sensitivity of the price of the note to the General Electric Company's stock price on April 3, 2009.
2. CDS rates can be considered a measure of the probability that an issuer will default over a certain period of time and the likely loss given a default. The lower the CDS rate, the lower the default probability. CDS rate is given in basis points (1 basis point equals 0.01%), and is considered as a market premium, on top of the risk-free rate, that investors require to insure against a potential default.
3. Fair price evaluation is based on the Black-Scholes model of the General Electric Company's stock on April 3, 2009.
4. Calculated payout at maturity is only an approximation, and may differ from actual payouts at maturity.
5. Our evaluation does not include any transaction fees, broker commissions, or liquidity discounts on the notes.
